

BOOK 5

MathWise / Erdos

A Mathematical Record of Deterministic Evidence

A strong mathematical spine, with the limits written beside the result.

Grounded DI LLC

Curated from the connected GitHub record, submitted local files, and public visual captures.

Version 1.0 | Corpus frozen 31 July 2026

01 / Scope and reading rule

What this book is, and what it deliberately refuses to imply.

Book 5 collects public artifacts whose primary subject is mathematics, MathWise, or an Erdos-related investigation. It is a source-indexed record, not an independent mathematical review. The book carries forward the language of the underlying repositories: fixed case, replayable, review-ready, conjectural, partial, or visual record.

The selection rule is simple: include an artifact when its repository, file, public-record capture, or registry entry directly concerns math, MathWise, or Erdos. Then separate the result from the evidence that supports it and from the claims the source expressly excludes.

This creates a deliberately layered book:

- Main spine: exact fixed-case certificates, exact local root isolation, exact rational lower bounds, and reproducible counterexample packages.
- Origin layer: July-August 2025 MathWise experiments, retained for provenance and evolution, not promoted to proof status.
- Public-record layer: submitted screenshots and dated social captures, preserved as visual evidence of what was posted or displayed.
- Boundary layer: explicit exclusions, non-claims, and verification status so a replay result is not silently upgraded into external validation.

Status vocabulary

Term	Meaning in this book
Fresh local replay	A supplied verifier or reconstruction was run again locally and reproduced the stated invariant result.
Review-ready	The package is organized for independent inspection; no independent acceptance is implied.
Externally verified	Not claimed unless an independent reviewer separately runs and accepts the relevant process.
Visual record	A submitted screenshot preserves what was displayed; it does not authenticate the underlying computation.
Historical / origin	A dated source is useful for lineage and evolution, but is not used as proof of a current theorem.

Editorial principle: the strongest sentence in the book is the strongest sentence the source actually earns.

02 / Book 5 at a glance

The mathematical spine selected from the 90-repository GitHub inventory.

90 accessible repositories	8 MathWise-named repositories	15 submitted visual captures	10 registry demonstrations
--------------------------------------	---	--	--------------------------------------

Core evidence	Primary source layer	Evidence readout	Boundary
Erdos 124 fixed case	MathWise replay package + subset-sum certificate	Fresh local replay; 3,119,493 systems; survivors 0	$D=\{3,4,7\}$, $k=1$ only; not general BEGL
Erdos 125 root isolation	Primal-anchored rotation packet	Exact rational Krawczyk inclusion; unique root in stated box	Local algebraic fact; not a full solution
Erdos 125 global multirow	Formal certificate + clean-room packages	Verifier, manifests, hashes, proof packets; registry full pass after repair	Fixed operator instance; not the general problem
Erdos 390	Replay certificate registry	Exact rational 13-layer lower-bound certificate	Partial theorem; no full solution
$D=\{3,4,7\}$ conductor	Tail certificate + endpoint package	$[582, \text{infinity})$ plus 581 nonrepresentable	Fixed case only
$D=\{3,4,5\}$ conductor	Tail certificate package	$C(\{3,4,5\},1)=80$; replay PASS	Fixed case only; no third-party acceptance
BH counterexample	MathWise two-block package	Interval-arithmetic FDR lower bound and hashes	Fixed alpha window; attribution boundary preserved
MathWise polygon replay	MathWise commit + five receipts	Same canonical/data/SVG/ZIP hashes; zero coordinate mismatch	Artifact identity is not independent generation

The registry is the backbone because it separates computation, packaging, execution provenance, local replay, external verification, and scope. That separation is the organizing logic of this book.

03 / Source layer and chronology

The current certificate packages sit on top of a visible 2025 origin trail.

Date	Source event	Book 5 reading
29 Jul 2025	MathWise partition-function estimate and entropy correction	Concrete proposed formula; historical/origin exhibit, not a certified theorem
03 Aug 2025	Prime Echo / Ulam lattice with diagonal compression and local entropy	Explicit formulas and a public conjecture; no validation or proof in the source
04 Aug 2025	Toroidal entropy cascade / applied PDE sample	Retained in the hold register; sample output is not backed by a visible solver replay
10 Aug 2025	DI-Archive Ulam spiral note with generator and counts	Stronger origin record because executable code and counts are preserved; still not independent proof
19 Oct 2025	Dated public-record drops with Prime Echo and MathWise DI2 application material	Public evolution and visual context; not elevated to theorem status
17-20 Jul 2026	Erdos 125 root, BH counterexample, Erdos 125 global release, MathWise polygon replay	Current mathematical certificate layer
23 Jul 2026	Replay certificate registry publishes intake records	Evidence vocabulary and mathematical registry backbone
31 Jul 2026	Book 5 curation freeze	This edition's source boundary

GitHub source inventory

The connected organization view returned 90 repositories. Eight repository names contain MathWise directly: MathWise, MathWise-Replayable-Fixed-Case-d347-k1-Erdos-124, MathWise_Subset_Sums_of_Powers_of_3_4_7, mathwise_tail_certificate_d345_k1_v1_0_0, MathWise-D347-Exact-Conductor-Endpoint, MathWise_Erdos_125_Primal_Anchored_Rotation_Root_Isolation, MathWise_Erdos_125_Global_Multirow_Coercivity_Certificate, and MathWise_BH_Two_Block_Counterexample. The book also uses the replay registry and DI-Archive because they preserve the evidentiary and historical context around those repositories.

The source state is mutable. Where a meaningful commit anchor was available, the ledger records it. Where the book uses a current README or file path, the source link identifies the live public record at the curation date.

04 / MathWise origin exhibits

July-August 2025 is included, but its role is lineage and public mathematical exploration.

Exhibit 4A - Partition Function Estimate

The July 29, 2025 MathWise file proposes an entropy-corrected expression for the partition function. The source includes a date, a concrete formula, a plot reference, and a disclaimer inviting public review.

```
p(n) ~= eta(n) - (1/24) * n / (n + log(n+1))
eta(n) = exp(pi * sqrt(2n/3)) / (4n * sqrt(3))
```

ORIGIN RECORD	Concrete proposed formula and dated source. This book does not treat the proposal as a validated replacement for the classical estimates.
---------------	---

Source: [MathWise / Partition Function Estimate.md](#). Original source date: 29 July 2025; source commit anchor available in the ledger.

Exhibit 4B - Prime Echo / Ulam Lattice

The August 3, 2025 Prime Echo file records a Ulam spiral, diagonal band compression, a local entropy pulse, and a stated deterministic conjecture about wave-like structure in prime placement.

```
P(n) = 1 if n is prime, else 0
D_theta(x,y) = x*cos(theta) + y*sin(theta)
E_local(n) = abs(P(n+1) - 2P(n) + P(n-1))
theta = pi/4 or 3pi/4
```

CONJECTURE	Explicit formulas and an observable visualization proposal are preserved. The source does not provide a proof or independent validation of a new prime-distribution law.
------------	--

Source: [MathWise / Prime Echo Lattice Demo.md](#). Original source date: 03 August 2025.

05 / Origin archive and held material

The book preserves the early record without letting it carry a stronger claim than its evidence.

Exhibit 5A - DI-Archive Ulam Spiral

The August 10, 2025 archive note includes a public invitation for mathematical feedback, an executable generator, and stated counts for three quadratic forms over $n=1..100$: 33 primes for $4n^2+1$, 86 for n^2+n+41 , and 27 for $6n^2+1$.

That makes it a stronger historical artifact than a purely visual post: a reader can inspect the generator and the stated counting procedure. It remains an origin record, not a proof that the observed diagonals imply a new law of prime distribution.

HISTORICAL / EXECUTABLE

Code and counts are preserved. Independent mathematical review is still required for any broader inference.

Source: [DI-Archive / Diagonal Prime Density Ulam Spiral.md](#). Archive commit: 00993ce018675a8c48f2ef844f845760fb3f458a.

Exhibit 5B - Toroidal Entropy Cascade

The August 4, 2025 MathWise file defines a synthetic coupled PDE problem and supplies a sample JSON output: `stableChargeBands=3`, `finalCoherence=0.914`, and `EDI=0.0382`. The file itself states that a deterministic logic solver is required; the source layer reviewed here does not include the solver or a replay log that would justify treating the sample output as a computed result.

HELD OUT OF MAIN SPINE

Useful as an early applied-math exploration. Excluded from the proof section because the visible source does not establish solver execution, replay, or independent validation.

Source: [MathWise / Toroidal Entropy Cascade.md](#). Original source date: 04 August 2025; commit 5de6884f8e0098cb6adc7522e658610d1c7e42ac.

Editorial decision on July-August 2025

Keep the partition and Ulam materials in the origin section. Keep the DI-Archive generator as the stronger historical exhibit. Keep the toroidal PDE in the hold register, not the mathematical spine. This preserves the evolution of MathWise without turning early experiments into later certificates.

06 / Exact fixed-case mathematics

Two conductor packages provide the cleanest compact theorem spine in the corpus.

D={3,4,5}: exact conductor 80

The tail certificate package states and replays the fixed-case theorem $C(\{3,4,5\},1)=80$: every $n \geq 80$ is representable as a subset sum of distinct positive powers generated by 3, 4, and 5, while 79 is not representable.

```
TAIL CERTIFICATE REPLAY: PASS
INFINITE TAIL CERTIFIED: [80, infinity) subset SubSum(B)
COMBINED RESULT: C({3,4,5},1) = 80
FINAL STATUS: PASS | EXACT_CONDUCTOR_PROVED
```

The proof structure is visible: a finite interval check over [80,3156], followed by an overlap propagation inequality for later basis elements. The package includes a verifier, replay log, witnesses, scope limitations, and SHA-256 manifest.

FIXED-CASE PASS

Replayable exact-conductor certificate. The repository expressly excludes a general BEGL result, other triples, $k \neq 1$, density, asymptotic, classification, and independent third-party acceptance.

Source: [mathwise_tail_certificate_d345_k1_v1_0_0 / README.md](#). Certificate commit: 1f1f8d94b71b5e5df16685efcd5d39504eed7459.

D={3,4,7}: exact conductor 582

The related fixed-case package supports $[582, \text{infinity}) \text{ subset } A_1(\{3,4,7\})$ and the endpoint package checks that 581 is not representable. Together, within the stated fixed case, the two packages establish the exact conductor $C=582$.

```
[582, infinity) subset A_1({3,4,7})
581 not representable
combined fixed-case conclusion: C = 582
```

The covering package reports three weighted-gap systems with initial counts 1,361,889; 255,938; and 1,501,666, for a total of 3,119,493, with zero final survivors in each case. It also preserves the finite interval [582,4460] and the overlap constant 1163.

FIXED-CASE PASS

The endpoint and tail evidence are complementary. Neither package claims a general theorem, an optimality statement outside the fixed case, density, asymptotics, or third-party acceptance.

Source: [MathWise_Subset_Sums_of_Powers_of_3_4_7 / README.md](#). Certificate commit: f7829c6a9aa6e41cb3b6c72618189d6594258c88.

Source: [MathWise-D347-Exact-Conductor-Endpoint / README.md](#). Endpoint package source.

07 / Erdos 124: replayable fixed-case certificate

The registry supplies the cleanest evidence-status language in the corpus.

The external-review package is intentionally narrow. It supports only the fixed case $D=\{3,4,7\}$, $k=1$ and the tail statement $[582,\text{infinity})$ subset $A_1(\{3,4,7\})$. Its proof chain is explicit:

Stage	Preserved operation	Readout
1	Finite interval certificate	[582,4460] covered by the stated finite subset-sum basis
2	Conditional interval-overlap propagation lemma	Carries the finite coverage forward under the stated overlap condition
3	Weighted Gap Lemma replay	Three finite residue-admissible systems reconstructed and eliminated
4	Global overlap inequality	$S(t)-t \geq 1163$, yielding the stated tail conclusion

System	Initial	Final survivors
Case A	1,361,889	0
Case B	255,938	0
Case C	1,501,666	0
Total	3,119,493	0

FULL PASS - FRESH
LOCAL REPLAY

The registry records a successful fresh local verifier execution. The package is review-ready. It is not described as externally verified because no independent reviewer acceptance is preserved.

Non-claims carried into Book 5

- No general BEGL result.
- No result for any D other than $\{3,4,7\}$.
- No result for $k \neq 1$.
- No endpoint below 582 and no optimality, density, or asymptotic theorem.

Source: [MathWise-Replayable-Fixed-Case-d347-k1-Erdos-124 / README.md](#). The README labels the package external-review ready and explicitly separates local replay from external verification.

Source: [Replay Certificate Registry](#). Registry commit containing the Erdos 124 and Erdos 390 intake records: f8864da5bfb4c5f4ca1571217dac2ce082d744d8.

08 / Erdos 125: local root to fixed global certificate

Two packages show a meaningful progression, while both keep the global claim bounded.

8A - Primal-anchored rotation root isolation

The root-isolation packet certifies a narrow local algebraic fact: a specified 37-variable rational polynomial system has a unique real root inside a box of common radius $1e-100$ centered at a supplied 120-decimal rational approximation.

Certificate element	Recorded result
Variables	37-variable rational polynomial system
Precision	Numerical root to approximately 430 digits
Isolation	Exact rational Krawczyk norm bounds and strict inclusion
Local checks	Branch signs, minors, full-rank Jacobian, residual approximately $2e-430$
Objective	Conditional interval beginning 0.004595978740187832...

LOCAL CERTIFICATE

A certified local root-isolation packet for a primal-anchored rotation branch. It does not establish an exact K-completion, global coercivity, global optimality, or a solution of Erdos 125.

Source: [MathWise_Erdos_125_Primal_Anchored_Rotation_Root_Isolation / README.txt](#). Commit anchor: 7a72abc939222ba1e92d6052ff619d555d871039.

8B - Global multirow coercivity certificate

The later fixed-instance package extends the certified setup to a formal global multirow certificate. It records a unique target, finite-state Schur conditions, dual optimality, arbitrary-height Schur induction, and the operator bound $1/2 I \leq W2(c^*) \leq 2 I$ on the exact interval and instance specified by the certificate.

The release includes the formal certificate PDF, exact source-functional packets, clean-room verification archives, verifier source, locked requirements, manifests, SHA-256 checksums, reproduction instructions, a validation report, and scope/limitations materials.

FULL PASS / DOCUMENTED REPAIR

The registry records a packaging-only repair followed by clean-room mathematical replay. The package remains a fixed-instance certificate, not a complete solution of the general Erdos 125 problem.

Source: [MathWise_Erdos_125_Global_Multirow_Coercivity_Certificate / release](#). Release commit: 20 July 2026.

09 / Adjacent mathematical certificates

These packages widen the record without weakening its labels.

Erdos 390 - exact rational partial lower bound

The replay registry records a thirteen-layer lower-bound certificate supporting the partial statement:

```
liminf (((f(n) - 2n) * log n) / n) >= 4029639598 / 25970038185
```

The certificate uses 13 disjoint obstruction-prime layers over $Q=\{2,3,5,7,11,13,17,19,23\}$, checks 104 dual inequalities and 9 tight capacity constraints, and establishes exact primal-dual equality without floating-point proof arithmetic.

FULL PASS - FRESH LOCAL REPLAY

The registry labels the result an expert-review candidate and a partial theorem. It does not claim a full solution of Erdos 390.

Benjamini-Hochberg two-block counterexample

The MathWise package records a two-block, one-factor Gaussian construction showing that ordinary Benjamini-Hochberg can fail false-discovery-rate control for correlated two-sided tests. At $\alpha=0.01$, the outward-rounded interval certificate gives:

```
lim inf FDR_N >= 0.010155532664618129... > 0.01
```

The repository also includes a certificate over α in $[0.00998, 0.01002]$, reproducibility programs, verification outputs, and SHA-256 hashes. The attribution note is part of the evidence boundary: Grounded DI posted this two-block construction with Edgar Dobriban's express permission, while expressly distinguishing it from his separate three-block preprint and making no authorship claim over that work.

INTERVAL CERTIFICATE

A fixed construction with reproducibility materials and attribution limits. The result is not a general statement about every multiple-testing setting.

Source: [MathWise_BH_Two_Block_Counterexample / README.md](#). Certificate commit: 3c32a69c08618c30ed00538e882601636b2bee8d.

10 / MathWise polygon replay

The strongest generative-artifact record is about repeatability and identity, not a mathematical theorem.

A July 20, 2026 MathWise commit reports five independent runs of a Polygon Cascade demo. The visible invariants are the same canonical payload, mathematical data, SVG, and ZIP SHA-256 hashes every time; coordinate mismatches are zero; maximum coordinate error is 0.0; and the benchmark status is PASS.

Runs: 5
Coordinate mismatches: 0
Maximum coordinate error: 0.0
Polygon Cascade Benchmark: PASS
One Input -> One Output

Artifact	Recorded hash prefix	Interpretation
Canonical payload	87f40ead722e...	Same canonical input across the receipts
Mathematical data	44b635f9c684...	Same generated numeric data
SVG	9cf49bf3527c...	Same vector artifact
ZIP	0ca1239ede5b...	Same package bytes

REPLAYABLE
ARTIFACT

A strong repeatability and package-identity record. Matching hashes do not, by themselves, prove that every artifact was independently generated from scratch.

Source: [MathWise / Polygon Cascade five-run commit](#). Commit date: 20 July 2026.

The next pages preserve the submitted visual record. Captures are useful for provenance, chronology, and public-facing design continuity. They are not substituted for repository files, verifier logs, or mathematical review.

11 / Submitted visual record - MathWise and Erdos captures

Submitted visual captures are preserved as public-record context. They are not independent authentication of the underlying claims.

X capture: MathWise DI2 Cosmic Web; one input -> one output visual record.

X capture: MathWise Ulam Spiral demo dated 03 August 2025; DBC and local entropy overlay.

X capture: Erdos 124 / BEGL fixed-case post with systems checked and survivor counts.

Threads capture: MathWise Highway Dragon rerun; deterministic check and matching hashes.

Threads capture: MathWise Koch Snowflake rerun; segments, points, and exact-file match.

X capture: primes under DI2 logic; quadratic polynomial overlay on the Ulam spiral.

12 / Submitted visual record - repository captures

Submitted visual captures are preserved as public-record context. They are not independent authentication of the underlying claims.

GitHub capture: subset-sums, IntakeWise, and MathWise reusable Erdos 124 repositories.

GitHub capture: D345 tail certificate, ShoppingWise, BriefWise, and adjacent applications.

GitHub capture: release-control benchmark and MathWise D347 exact conductor endpoint.

GitHub capture: BH two-block counterexample and Erdos 125 primal-anchored root isolation.

GitHub capture: Erdos 125 global multirow certificate and repository context.

13 / Claim-boundary register

A compact control surface for future review, publication, or external replication.

Artifact class	What the source supports	What Book 5 will not say
D345 exact conductor	$C(\{3,4,5\},1)=80$ under the fixed package and replay	Not a general BEGL theorem or third-party acceptance
D347 tail + endpoint	$[582,\text{infinity})$ plus 581 nonrepresentable, hence $C=582$ in the fixed case	Not a result for other D, other k, or an asymptotic classification
Erdos 124 registry record	Fresh local replay of the packaged fixed-case verifier	Not externally verified unless an independent reviewer accepts it
Erdos 125 root	Unique local root in the stated rational box	Not a complete proof of Erdos 125
Erdos 125 global	Fixed-instance multirow certificate with hashes and clean-room packages	Not general global coercivity beyond the stated instance
Erdos 390	Exact rational partial lower-bound certificate	Not a full solution of Erdos 390
BH two-block	Fixed correlated Gaussian counterexample with interval arithmetic	Not a universal statement about all FDR procedures or all settings
MathWise origin	Dated public mathematical proposals and formulas	Not validated number-theory evidence
Visual captures	What was publicly displayed or posted	Not source authentication or independent computation

Recommended external-review gate

- Clone each cited repository at the recorded commit or a preserved release state.
 - Run each verifier from a clean environment and retain terminal output, dependency versions, and SHA-256 checks.
 - Have an independent reviewer inspect the proof chain and accept or reject the mathematical conclusion separately from package integrity.
- Keep theorem scope, replay status, provenance, and attribution as separate fields in any future release.

This gate is intentionally procedural. A matching archive or a successful local run is valuable evidence, but each is only one link in the full chain.

16 / Editorial verdict

Book 5 is ready as a curated mathematical record, with an honest status line on every major artifact.

The book has a strong mathematical spine. The fixed-case conductor packages, Erdos 124 replay record, Erdos 125 local-to-fixed-global certificate progression, Erdos 390 exact rational lower bound, and BH interval counterexample form a coherent record of deterministic mathematical artifacts with increasingly explicit replay and package-integrity controls.

The July-August 2025 material belongs in the book because it explains where the MathWise line began and how the public visual language developed. It does not belong in the proof section. The toroidal PDE artifact is correctly held out of the main spine until a solver, replay, and independent review are preserved.

The governing conclusion is therefore precise:

Book 5 is a review-ready, source-indexed mathematical record of Grounded DI's MathWise and Erdos-related public artifacts as of 31 July 2026. It is not an independent peer review, not a general theorem claim, and not an assertion that every displayed result has been externally verified.

Edition	Book 5 - MathWise / Erdos Mathematical Record
Owner	Grounded DI LLC
Curation freeze	31 July 2026
Primary source layer	Grounded-DI GitHub organization, current READMEs and commit anchors
Supporting layer	Submitted PDFs, JSON, runtime package, screenshots, and earlier public-record books
Next gate	Independent clean-room replay and mathematical review, recorded separately from packaging integrity

Precision does not infer. It traces.

End of Book 5 / Version 1.0
